

Microsoft Office - XML Namespaces

```
xml:namespace prefix = o ns = "urn:schemas-microsoft-?>  
</ "com:office:office
```

Microsoft Office XML Namespaces

Microsoft Office XML Namespaces are used to identify the different parts of an Office document. The namespaces are defined in the Office Open XML (OOXML) specification. The namespaces are used to identify the different parts of an Office document, such as the main document content, the document structure, the document metadata, and the document relationships. The namespaces are used to identify the different parts of an Office document, such as the main document content, the document structure, the document metadata, and the document relationships. The namespaces are used to identify the different parts of an Office document, such as the main document content, the document structure, the document metadata, and the document relationships.
